SKILL-- 2

Enable MFA on the root user of your account and prepare a short note comparing virtual MFA devices, hardware MFA devices and FIDO security keys.

Step 1 :

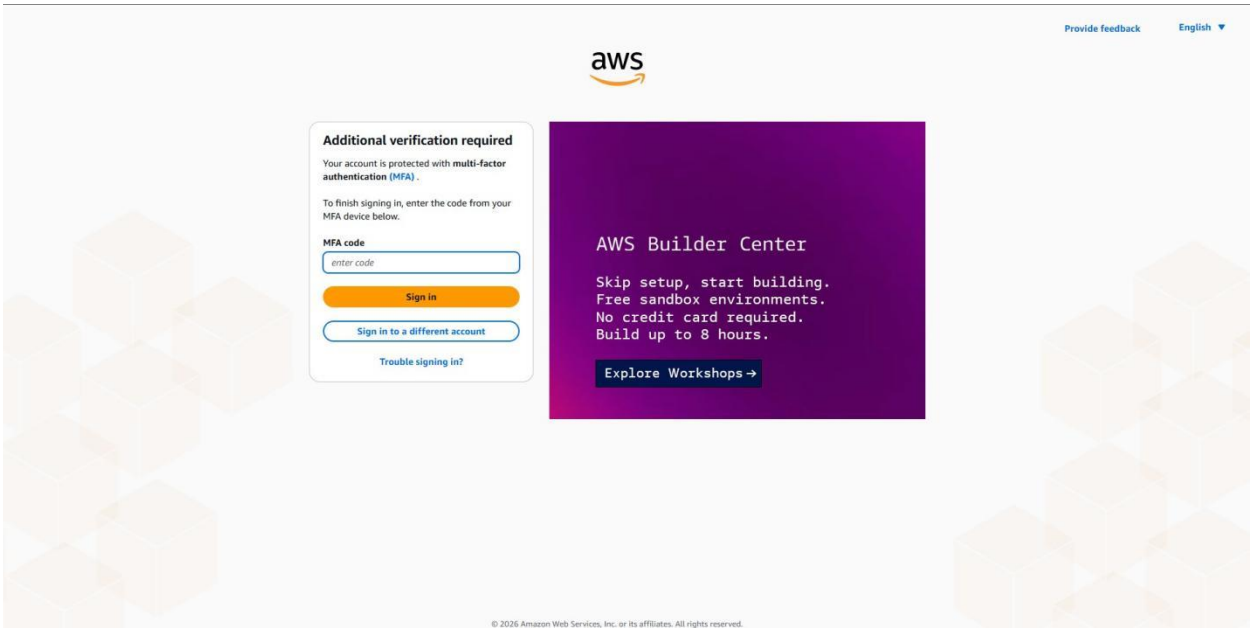

Step 2 :

Set up authenticator app
An authenticator app is an application running on your device that you can configure by scanning a QR code.
1
Install a compatible application such as Google Authenticator, Duo Mobile, or Authy app on your mobile device or computer.
See a list of compatible applications
2
Show QR code
Open your authenticator app, choose Show QR code on this page, then use the app to scan the code.
Alternatively, you can type a secret key.
(Show secret key)
3
Enter two consecutive codes from your authenticator app. Enter the first code, wait a few seconds and then enter the second.
First code
6 digit code
Second code
6 digit code
Cancel
Register MFA

Step 3:

aws
Register virtual MFA device
You have successfully assigned this virtual MFA device.
We encourage registering multiple MFA devices in case your primary method is lost or inaccessible.

Step 4 :

1. Virtual MFA Devices

- Software-based applications installed on smartphones or computers.
- Generate time-based One-Time Passwords (TOTP).
- Examples: Google Authenticator, Microsoft Authenticator.
- Convenient and cost-effective but depend on the security of the device.

2. Hardware MFA Devices

- Physical devices that generate authentication codes.
- Generate OTPs without requiring a smartphone app.
- Examples: Hardware OTP tokens and key fobs.
- More secure against certain software-based attacks but can be lost or damaged.

3. FIDO Security Keys

- Physical devices that use public-key cryptography for authentication.
- Connect through USB, NFC, or Bluetooth.
- Examples: YubiKey and Google Titan Security Key.
- Highly secure, phishing-resistant, and do not require users to enter OTPs.
